

Department of Electronics and Communication Engineering

Question bank of 1st module

Subject: Introduction to c programming

Sub Code: BESCK104E

Semester/Section:1st sem, B section

1. Write basic structure of 'c' program and explain its different sections.
2. List any 3 input and 3 output devices of a computer and explain any one each.
3. Define computer. Briefly explain the stages involved in program design.
4. List and briefly explain the files used in C program.
5. List the advantages of c language.
6. List the different steps used in execution of creating the source code.
7. Briefly explain the structure of c program.
8. Define variable. Explain rules for constructing variable in 'c' language ?Give example for valid and invalid variable..
9. Differentiate between formatted I/O statement and unformatted I/O statement.
10. What is a data type Explain all the basic data types available in 'c' language with example.

Department of Electronics and Communication Engineering

Question bank of 2nd module

Subject: Introduction to c programming

Sub Code: BESCK104E

Semester/Section:1st sem, B section

1. List the various operators in C.
2. What is type casting? Mention its use with suitable example.
3. Differentiate between type conversion and type casting.
4. Write a c program to swap two integers without using temporary variable.
5. Explain the syntax (general form), flow chart and working of if-else statement.
6. Explain the syntax and working of switch case statement. Mention in which situation it is desirable.
7. What is looping. Write the different types of loops in c programming.
8. Give the syntax and working of simple if statement.
9. Explain the syntax and working of break and continue statement.
10. Write a 'c' program to find area and circumference of circle.
11. Compare the working of **for**, **while**, and **do-while** along with their syntax.
12. Write a c program to compute roots of a quadratic equation for non zero co-efficient of a, b and c.
